

Release Notes - Novell ICS 1.2 - Support Pack 1
March 24, 2000

Table of Contents

- 1.0 Known Issues
 - 1.1 ICS Hangs on Restart
 - 1.2 Netscape Browsers Don't Display ICS PDF Files
- 2.0 Resolved Issues
 - 2.1 Read-Ahead Parsing Zero-Length URLs Incorrectly
 - 2.2 ICS Not Throttling Tunnel Connection Data
 - 2.3 ICS Not Handling POST Transmissions
- 3.0 New Features and Clarifications
 - 3.1 HTTP Minimum Value
 - 3.2 New Import/Export Options
- 4.0 Command Line and GUI Sluggishness during Startup
- 5.0 Fine-Tuning Appliance DNS Name Resolution
 - 5.1 How ICS Resolves DNS Names
 - 5.2 How ICS Formulates Subsequent DNS Queries
 - 5.3 Modifying the R_APPEND.CFG File
- 6.0 Using WCCP V2
- 7.0 Enhancements and Changes to Online Documentation
 - 7.1 Links to Readmes and the Quick Start
 - 7.2 ICP Server Listening Port
 - 7.3 Managing Log Files
 - 7.4 Filter Service Logs and Common Log Format
- 8.0 Legal Information
 - 8.1 Disclaimer and Copyright
 - 8.2 Trademarks
- 1.0 Known Issues
 - 1.1 ICS Hangs on Restart

ICS will not restart completely when the following conditions exist in combination with each other:

 - The eth0 network adapter is connected to the network
 - The eth0 network adapter is configured with a

valid IP address or has been reconfigured to use a 10-net address

- No other network adapters have IP addresses set and they are not connected to the network
- Factory settings have been restored from the browser-based management tool or the command line

To get around this problem, do the following:

- 1) Disconnect eth0 from the network.
- 2) Manually restart the appliance.
- 3) After the appliance restarts and you hear the startup beep sequence, reconnect eth0 to the network.

1.2 Netscape Browsers Don't Display ICS PDF Files

The online help home page includes links to PDF files. Netscape browsers display these as ASCII.

All release notes are also available in text format, but the PDF versions of the Administration Guide and the Quick Start cannot be viewed with a Netscape browser.

2.0 Resolved Issues

The following conditions have been addressed in Support Pack 1.

2.1 Read-Ahead Parsing Zero-Length URLs Incorrectly

When this condition occurred, the appliance would restart.

ICS 1.2 SP1 parses zero-length URLs correctly.

2.2 ICS Not Throttling Tunnel Connection Data

In some cases when tunnel connection data (SSL, FTP, POST) was being retrieved by ICS faster than the receiver was accepting the data, the appliance would stop responding to incoming requests.

ICS 1.2 SP1 throttles tunnel connection data, thus stabilizing system performance.

2.3 ICS Not Handling POST Transmissions

In some cases a large POST transmission was being corrupted, causing POST method failure and requiring the user to resubmit the request. ICS performance was not impacted.

ICS 1.2 SP1 does not corrupt POST transmissions.

3.0 New Features and Clarifications

3.1 HTTP Minimum Value

In the browser-based management tool, setting the HTTP Minimum value to 0 in Cache > Tuning > Cache Freshness causes the option to have no effect.

3.2 New Import/Export Options

You can now download configuration files from a floppy disk in the appliance's floppy drive. You can also import a configuration file from any URL to either the appliance or to its floppy drive.

4.0 Command Line and GUI Sluggishness during Startup

Appliances with more than one disk drive execute mirroring and cloning processes when the system starts the first time. These one-time processes are required for ICS system fault tolerance and must run to completion.

While the processes are running, the console and the browser-based management tool might seem sluggish for as long as a couple of minutes.

Cache performance is also somewhat affected by the processes.

IMPORTANT: Do not restart the appliance. This only causes the mirroring and cloning processes to restart and delays the arrival of normal system response times.

5.0 Fine-Tuning Appliance DNS Name Resolution

The ICS_RDME.TXT file in ICS 1.2 indicates that DNS names ending with domain extensions other than .com, .org, and so on, are sometimes resolved in unexpected ways.

You can now customize how ICS resolves DNS names.

5.1 How ICS Resolves DNS Names

When ICS receives a browser request, it creates a DNS query based on the URL in the request and sends the query to one of the DNS Name Servers defined for the appliance.

If the DNS Name Server can't resolve the query, ICS formulates subsequent DNS queries based on the following:

- The appliance's domain name
- The appliance's R_APPEND.CFG file

5.2 How ICS Formulates Subsequent DNS Queries

Assume the following:

- The browser request URL is webserver.
- The appliance's domain name is acme_ics.com.
- The appliance's R_APPEND.CFG file has the following content:

```
www.%s.com
www.%s.edu
www.%s.org
www.%s.gov
www.%s.net
%s.com
%s.edu
%s.org
%s.gov
%s.net
www.%s
```

If the initial DNS query fails, ICS does the following:

1. It formulates a second query by appending the appliance's domain name to the URL as follows:

webserver.acme_ics.com

2. If this query fails, ICS appends the appliance's sub domain name to the URL as follows:

webserver.com

3. If this query fails, ICS appends each entry in the R_APPEND.CFG file in the order listed until one of the following occurs:
 - The DNS server returns an IP address for the name.
 - ICS's query options are exhausted and it returns a DNS error to the browser.

If a DNS name has already been tried, ICS skips the query and moves to the next item in the list.

Continuing with the example, ICS would submit the following queries, substituting webserver for the %s variable in the lines of the R_APPEND.CFG file.

```
www.webserver.com
www.webserver.edu
www.webserver.org
www.webserver.gov
www.webserver.net
webserver.edu
webserver.org
webserver.gov
webserver.net
www.webserver
```

Since webserver.com was tried previously, ICS skips the sixth line (%s.com) in the R_APPEND.CFG file.

5.3 Modifying the R_APPEND.CFG File

- 1) Start an FTP client on a workstation with access to the appliance.
- 2) Point the FTP client to one of the appliance's IP addresses.
- 3) Enter the following command:

```
get ETC\PROXY\APPLIANCE\CONFIG\USER\R_APPEND.CFG
```

The file is transferred to the FTP client's default directory.

- 4) Referring to the example in the previous section, modify the R_APPEND.CFG file using an ASCII editor.

Ensure that the lines in your file reflect the query order and content you want ICS to use when attempting DNS name resolution. For example, you might want to reorder the domains listed or include two-letter country codes in the list.

- 5) Use the put command to place the modified R_APPEND.CFG file back in
ETC\PROXY\APPLIANCE\CONFIG\USER on the appliance.
- 6) Restart the appliance.

6.0 Using WCCP V2

Cisco recommends that customers use IOS 12.05t or later for WCCP v2 to work as planned.

7.0 Enhancements and Changes to Online Documentation

The following items have been corrected in the online documentation where appropriate.

7.1 Links to Readmes and the Quick Start

The first page of the online documentation now contains links to the ICS 1.2 Quick Start and Readmes.

7.2 ICP Server Listening Port

The ICS 1.2 online documentation for the ICP/CERN Configuration tab incorrectly implied that the ICP Server Listening port can have a hexadecimal value. ICS port number fields can be assigned only decimal values.

Valid port numbers are 0 through 65,535, not FFFF.

7.3 Managing Log Files

In Using Other ICS Services > Using ICS Logging Services > Using FTP to Manage Log Files, the documentation implies that you can determine the names of log files using FTP. This is incorrect. You can only retrieve log files via FTP, and this requires that you know the log filename.

ICS appliance log filenames can be listed in the browser-based management tool in Monitoring > Cache Logs. They can also be listed from the command line, or via a Telnet session.

ICS automatically generates log filenames as follows:

- 6 numbers representing the year, month, and day the file was created
- A dash separating the date from a letter identifier.
- Letter identifiers running from A through ZZ.

This naming convention accommodates up to 702 log files per day. If the rollover options are set so that all the possible file names are used in one day, the log file with the ZZ letter identifier is not closed until the start of the next day.

7.4 Filter Service Logs and Common Log Format

The common format used to log filter transactions must not be confused with the common log format used for logging caching services. Although some overlap of fields exists, filter logs require a different set of information. This has been clarified in the online documentation.
